

# netVigilance Vulnerability Assessment Guide

## Choosing The Delivery Option That's Best For You

Only netVigilance goes Beyond Compliance to identify and detect up to 97% of common network vulnerabilities, far more than any competitor. This Guide briefly describes our delivery options and helps you quickly determine which netVigilance solutions are best for you.

### netVigilance Advantages

- » Focuses exclusively on solutions for Network Vulnerability Detection and Assessment, including PCI Compliance
- » Automatically produces robust reports that describe how to fix discovered vulnerabilities, saving its customers tens of thousands of dollars per year in time and effort that competitive solutions require
- » Has an extremely low false positive rate, enabling you to focus your resources on fixing actual vulnerabilities
- » Is an active member of the PCI ASV Task Force and the CVSS SIG under first.org, where we are a leader in industry efforts to improve these key standards

### Cloud Edition (Software as a Service) for Total Coverage™

The majority of our customers choose Total Coverage because they want to detect vulnerabilities across all areas of their network:

- Publicly accessible components at the perimeter, including web servers, firewalls, routers, mail servers
- Web application scanning
- Inside the firewall

For them, the Cloud Edition is the clear choice.

The benefits are numerous:

- No data to store – ever
- No worries about hardware or software upgrades – ever
- No worries about maintenance or IT support – ever
- No training needed – all you need is a browser
- No unpredictable costs – fixed monthly fee
- Fast and easy to use – lets your team concentrate on their jobs while ensuring vulnerability detection
- Internal scanning is simple with our remote scanning engine. Install the free version yourself in under 10 minutes on the workstation of your choice. And for those rare cases that require a dedicated appliance, you can select our EasyBox Appliance when ordering.

### Windows Edition (software download) for inside the firewall coverage

While the Cloud Edition is a broad, powerful solution that offers multiple benefits, a select minority of our customers require a software-based solution because they:

- Operate under government regulations, internal IT policies or legal restrictions that absolutely prohibit the use of a cloud or an external connection;
- Require that their internal vulnerability data stay in-house and never be accessible by their solution provider;
- Need the ability to perform internal scans both in offline environments and in online environments where the Internet connection is intermittent;
- Are only permitted to use our Cloud solution for their publicly-accessible components

In these cases, the netVigilance Windows-based Software option – which gives users the option of using their own MS-SQL server – is ideal. The only system requirements are Windows XP or Windows 2003 Server. EasyBox Appliance option also available.
