

netVigilance Total Coverage with PCI

Industry-Best Vulnerability Detection & Assessment

netVigilance Advantages

- » Focuses exclusively on solutions for Network Vulnerability Detection and Assessment, including PCI Compliance
- » Automatically produces robust reports that describe how to fix discovered vulnerabilities, saving its customers tens of thousands of dollars per year in time and effort that competitive solutions require
- » Has an extremely low false positive rate, enabling you to focus your resources on fixing actual vulnerabilities
- » Is an active member of the PCI ASV Task Force and the CVSS SIG under first.org, where we are a leader in industry efforts to improve these key standards

Fact: PCI Compliance is important. But it's not enough. Being only PCI Compliant puts your company at risk by giving you a false sense of security.

Fact: Only netVigilance's Total Coverage with PCI continually finds your security holes to ensure the safety of your company's network and your customers' data.

On July 24, 2009, web-hosting leader Network Solutions publicly reported that the credit card information of 573,928 individuals had been compromised over an almost 3-month period at 4,343 e-commerce sites.

Yet this company honestly believed it was safe and completely PCI compliant.

The risk is clear. And so is the solution – netVigilance Total Coverage with PCI. We go Beyond Compliance to detect vulnerabilities that compliance standards like PCI don't.

What PCI Compliance Is & Isn't

Most people think that becoming PCI Compliant simply means getting quarterly external scans. And while that is technically sufficient to pass, it only skims the surface of the PCI Requirements. These Requirements also specify Regular Internal Scans (Requirement 11.2.a), External Change Scans (Requirement 11.2.c), and External Web Scans (Requirement 6.6).

The truth is that most companies offering PCI Compliance are only administering these quarterly external scans. The Ponemon Institute reported that, in the last 12 months, 85% of organizations experienced data breaches. Because of the way that PCI Compliance is handled, many of them were likely compliant and at risk – all at the same time.

But there is no need to remain exposed to a continuing unacceptable risk. Only netVigilance's Total Coverage PCI completely satisfies not only the 6.6 PCI Requirement, but also the entire 11.2 PCI Requirement. The result of our Total Coverage with PCI is as close to Total Security for your company as possible.

Total Coverage with PCI Protects Your Company on an Ongoing Basis

We significantly mitigate your risks by finding the vulnerabilities that other companies don't. And Total Coverage with PCI keeps on working because the bad guys keep on working. Unlike a quarterly scan that leaves you open to risks for 89 days at a time, Total Coverage with PCI continually scans inside your network, at the perimeter, and across your web applications to detect new risks.

The question is: Do you want vulnerability detection and awareness 365 days a year or just 4 days a year? With quarterly scans, you're open to threats 361 days a year. Total Coverage with PCI is truly "total" because it:

- Covers you for 365 days, not just 4
- Detects up to 97% of common vulnerabilities, while a typical ASV scan finds only about 50%
- Is up-to-date on the most recent and relevant vulnerabilities
- Works from the cloud, with an appliance or as installed software

The bottom line is that netVigilance Total Coverage with PCI helps you stop the enemy before he gets in the door, and it identifies more vulnerabilities than any other solution on the market. Total Coverage with PCI goes Beyond PCI and Beyond Compliance to mitigate your company's risks better than any competitive solution. If you must do PCI, do it the right way – the netVigilance Total Coverage with PCI way.

Total Coverage with PCI

- » Covers you for 365 days, not just 4
- » Detects up to 97% of common vulnerabilities, while a typical ASV scan finds only about 50%
- » Is up-to-date on the most recent and relevant vulnerabilities
- » Works from the cloud, with an appliance or as installed software

Calculating Your Risks

According to the expert security analysts at the Ponemon Institute, who conducted a study sponsored by PGP, each and every compromised customer record will cost you \$202. That may sound small, but no one has just one customer.

If you have 1 million customers, that's 202 million dollars. Even if you only have 1,000 customers, that's still \$202,000. These risks are clearly unacceptable. Visit www.netvigilance.com or email pci@netvigilance.com to learn how Total Coverage with PCI can mitigate and effectively insure your customer data against these massive risks with almost zero time and effort from your staff.

Getting Started

To see the vulnerability detection capabilities of netVigilance for yourself, try our FREE Trial of netVigilance PCI Scan - Cloud. This is a key part of our Total Coverage solution, and like all our products, it goes Beyond Compliance. The result is that it detects more PCI vulnerabilities than any other solution in the market. To get your FREE Trial, simply call your Authorized netVigilance Reseller for details. If you do not have an Authorized netVigilance Reseller, just fill out the form on www.netvigilance.com/freetrial, and one will contact you within 24 hours.
